Trajectory interface pilot: actual sampled self-state (query time)

settle · pre_capture · provider_query · planning_input · command_start · execute · execute_end · Setpoint / configured budget

V2 | efficiency

n = 8 actual points

Protection exit:
Measured initial acceleration exceeds planner budget
Rejected acceleration vector not recorded

V2 | perception

n = 0 actual points

No recorded values in this clock view

Protection exit:
Measured initial acceleration exceeds planner budget
Rejected acceleration vector not recorded

V3 | efficiency

n = 25 actual points

V3 | perception

n = 25 actual points

Sampled body world NED z (m; down +)

AirSim query-clock elapsed from first query sample (s)

Actual sampled acceleration norm (m/s²)

n = 8 actual points

n = 0 actual points

No recorded values in this clock view

n = 30 actual points

n = 30 actual points

Actual sampled velocity norm (m/s)

n = 8 actual points

n = 0 actual points

No recorded values in this clock view

n = 30 actual points

n = 30 actual points

Separate clocks; independent origins per flight. Scatter only: no interpolation, continuous peak claim, or method-effect conclusion.
No planner/reference values. Missing actual values remain absent. World NED z is relative to simulation world origin, not terrain altitude.
